

COMPREHENSIVE CARE

Included in all of our piercing services is our Comprehensive Care. From the time we pierce to the time you are fully healed you are under our care. We provide treatment plans for possible infections, stud replacement for lost single studs, earring change outs after healing and complimentary saline solution. For serious signs of infection or trouble we may ask you to come back to our studio so we may diagnose and treat the piercing in person.

ADDITIONAL INFORMATION

The backs of your earrings will not be all the way down. This is to allow for swelling the first 24-48 hours. Once this time has passed you make push the backs until they are just touching the skin, but not so much to push into the skin.

Included in your bag are rubber backers. These help keep studs from losing backs and falling out. After your first cleaning please place these over the post of each earring to help ensure those new earrings don't get lost.

In the event a stud is lost we will replace the individual earring free of charge. For this service you must come into the studio any of our open business days.

Piercing After Care and Cleaning

What can I use to clean and care for my new piercing?

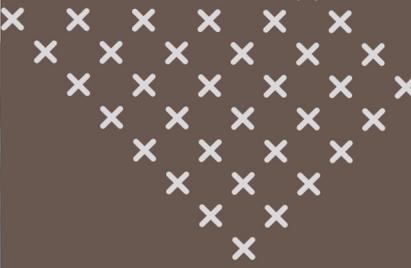

Cleaning Solutions

Only use sterile saline solution, provided to you, for regular care. This will help promote the healthiest and fastest healing times.

Gentle Anti-Bacterial soap can be used to gently clean around piercings, but is not a substitute for the sterile saline solution.

DO NOT USE

Avoid the use of alcohol, peroxides and antibiotic ointments. The use of chemicals can be harsh on new piercings and ointments can suffocate the healing opening. This creates longer healing times and irritated piercings. Only use these products as directed by your piercer for treatments of possible infection.

About Your New Piercing

WHAT SHOULD I EXPECT?

Initially: some bleeding, localized swelling, tenderness, or bruising

During healing: some minor itching, secretion of a white-yellowish fluid (plasma) with form and crust. If you fail to keep good hygiene and follow proper care you notice smelly bodily secretions accumulate and crust.

Healed piercings: piercings can look healed on the outside, but the deeper tissue is still recovering. Keep cleaning during the entire healing period and be patient.

New piercings can begin closing up in minutes so keep the jewelry in the ear throughout the entire healing period. After 6 weeks you may change the earrings out.

Even healed piercings can close or shrink after years of having them. Do not be alarmed if this happens, it varies from person to person.

Always keep your initial jewelry provided by us. They are pure titanium and allergy free. Should you react to other jewelry please put the titanium jewelry back in. Everybody reacts different to

KEEPING YOUR NEW PIERCING CLEAN

Wash your hands prior to touching your piercing

Use the sterile saline solution every few hours. A spray front and back of each piercing is enough. You may also use clean gauze soaked in saline and apply it to piercings that may be harder to spray

Use of gentle antibacterial soap

Use gentle soap to clean dirt, dried blood or plasma from new piercings. Avoid soaps with triclosan and strong fragrances

WHAT SHOULD I STAY AWAY FROM?

What to avoid

While showers, baths and pools are ok, you should avoid live bodies of water such as rivers, lakes, streams and beaches.

Avoid catching your new piercing on clothing, masks and bedding.

Try to stay away from rough play and hitting your piercing

WHAT SHOULD I LOOKOUT FOR?

Tenderness is normal for a day or two, but the piercing should not be painful. Pain is a sign of trauma from tearing, pulling, hitting or even the start of an infection. Children's Motrin or Ibuprophen for adults can help with swelling and tenderness.

Redness the first couple of days is not unusual. Redness that appears several days later is a sign that an infection may be starting. Should you believe an infection is starting please contact us immediately to implement a care and recover plan.
